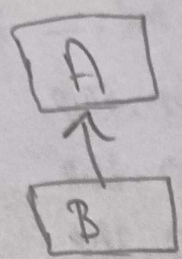
... up in inher...

Types of inheritance

Single inheritance:



Single inheritance enables class to inherit properties from a single parent.

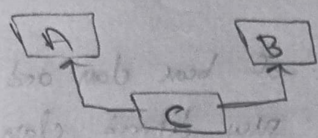
```
class Parent:
    def fun(self):
        print('parent class')

class Child(Parent)
    def fun2(self):
        print('child class')

obj = Child()
obj.fun()
obj.fun2()
```

Multiple inheritance:

When a class can be derived from more than one base class this type of inheritance is multiple



```
class Mother:
    ~~def~~
    Mothername = ''

    def mother(self):
        print(self.Mothername)

class Father:

    Fathername = ''

    def father(self):
        print(self.Fathername)

class son(Mother, Father):
    def parents(self):

        print('Father', self.Fathername)
        print('Mother', self.Mothername)

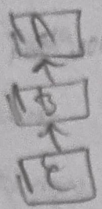
S1 = Son()

S1.fathername = 'Ram'

S1.Mothername = 'Fom'

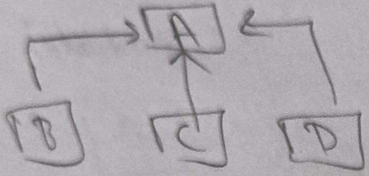
S1.parent()
```

Multilevel inheritance:



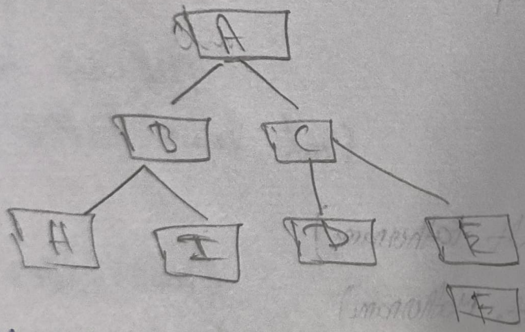
In multilevel inheritance features of base class and derived class are further ~~derived~~ inherited into new derived class.

Hierarchical inheritance:



When more than one derived class are created from single base this type of inheritance is hierarchical

Hybrid inheritance



Hybrid is a combination of more than one type of inheritance. We can mix like single, multiple, hierarchical etc..
